Key Adjustments in the Finalized Anti-Monopoly Guidelines for the Platform Economy

Author: Chen Ma  |  Da Shi  |  Xiao Guo  |  Jiahao Guo

Introduction: On February 7, 2021, the State Council Anti-monopoly Commission (the “Commission”) promulgated the Anti-Monopoly Guidelines for the Platform Economy (the “Guidelines”), following only three months after the State Administration for Market Regulation (“SAMR”) issued an exposure draft of the same on November 10, 2020 (the “Exposure Draft”), which unveiled a more rigorous approach to anti-monopoly regulation. The brief interval between the Exposure Draft and the finalized Guidelines demonstrates fully the importance the authorities have attached to anti-monopoly work in the platform economy.

In our November 12 article, The Way Forward: Anti-monopoly Guidelines for the Platform Economy, we put forward for reference our industry observations regarding the Exposure Draft. Comparatively, the Guidelines resemble the Exposure Draft in style and structure but also differ significantly with respect to certain content, which may impact regulatory policies going forward for platform economy undertakings. In this article, we analyze the key adjustments in the Guidelines in conjunction with our earlier observations.

The Guidelines confirm some of our earlier assumptions: the Guidelines refine provisions found in the Exposure Draft and reduce legal uncertainty, thereby helping platform undertakings to enhance their understanding of relevant policies, promoting the implementation of those policies, and facilitating the development of the platform economy. We therefore see a promising future for platform undertakings - undertakings simply need to properly understand the new policies and cooperate with regulators in implementing them.

In this article, we summarize the key adjustments in the Guidelines compared to the Exposure Draft in five aspects, basic principles, defining the relevant market, monopoly agreements, abuse of dominance, and concentrations of undertakings. In general, we find these adjustments take practical scenarios into sufficient account and are conducive to the innovative development of platform undertakings.
Abstract:

1. The Guidelines substantially modify the wording of basic anti-monopoly principles by adding expressions such as “preventing the disorderly expansion of capital” as mentioned at the meeting of the CPC Central Committee Politburo and the Central Economic Work Conference, and striking expressions such as “stay open and inclusive” and expressions used in regulatory policy for the new economy such as “stay inclusive and prudent.” From this, we understand anti-monopoly law enforcement will trend toward strengthening in the future, supported by detailed measures such as those specified in the Interim Measures for Administration of Subsidies for Anti-monopoly Work, promulgated by the Ministry of Finance.

2. The Guidelines further specify the methods for defining relevant markets in the platform economy by stipulating that relevant markets can be defined based on products on the platform, multiple relevant product markets can be defined respectively based on multiple related products on the platform, or multiple relevant markets can be combined into one market where the existing cross-platform network effects of a platform can impose sufficient competition constraints on platform undertakings. We expect regulators will have more flexibility in defining relevant markets in the platform economy in the future without struggling to consider which methods to employ. On this basis, the Guidelines do not contain a provision found in the Exposure Draft that would have permitted regulators to directly cite platform undertakings for abuse of dominance without first defining the relevant market in which the abuse occurred.

3. The changes in the monopoly agreement section are more akin to technical adjustments, of which two require particular attention. First, with respect to adjustments in horizontal monopoly agreements, the Guidelines specify that independent price-following behavior should not be regarded as a price cartel, so as to avoid undue interpretation of synergistic behavior that could result in disorder in the normal operation of markets. Second, the Guidelines specify the meaning of most-favored-nation treatment clauses (platform undertakings require business undertakings on the platform to provide the undertaking with transaction conditions equal to or more favorable than those offered to other competing platforms in terms of product price or quantity), and state that such clauses intersect with both vertical monopoly agreements and abuse of dominance.

4. With respect to abuse of dominance, the Guidelines retain the core content found in the Exposure Draft, such as the analysis framework for predatory pricing (below-cost sales), the “choosing-one-from-two” analysis framework, factors to consider when determining whether a platform constitutes an essential facility, and the prohibition on implementing different transaction terms based on big data and algorithms. It is particularly noteworthy that the Guidelines add two new bases to justify a platform undertaking selling below cost, which is intended to ease concerns over undertaking promotional activities, namely, “developing other businesses on the platform within a reasonable period of time” and “promoting the entry of new products into the market within a reasonable period of time.” Furthermore, the Guidelines identify data as a criterion to consider when determining whether a platform constitutes an essential facility and strikes content found in the Exposure Draft that could have deemed related data as essential facilities. In addition, the Guidelines also make appropriate adjustments to the definitions of “unreasonable transaction terms” and “differential
treatment in transactions”.

5. With respect to concentrations of undertakings, the Guidelines retain reporting requirements for control agreement structures while continuing to emphasize that regulators will closely scrutinize acquisitions of start-ups and emerging platforms, acquisitions that are not notifiable due to the adoption of free or low-price policies, and acquisitions with high market concentrations but which result in small overall market scale. In addition, the following changes are subject to special scrutiny: in calculating platform turnover, the Guidelines add “playing a leading role” as a criterion when analyzing the platform’s turnover generating model; and, in terms of behavioral remedies, the Guidelines add data as a facility subject to open access and stipulate that concentrations of undertakings can be conditionally approved, including with commitments to compatibility and to no decrease in interoperability.

Key adjustments to fundamental principles

The Guidelines make significant adjustments to expressions of fundamental competition law principles. We believe the following adjustments warrant special attention:

<table>
<thead>
<tr>
<th>Exposure Draft</th>
<th>Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Article 2 Basic Principles</strong></td>
<td><strong>Article 3 Basic Principles</strong></td>
</tr>
<tr>
<td>… …</td>
<td>… …</td>
</tr>
<tr>
<td>To create a fair competition order. The Guidelines aim to prevent and curb monopolistic behaviors that act to eliminate or restrict competition, maintain a fair, open and inclusive development environment in the platform economy, reduce market entry barriers, allow more market players to enter the market, participate in competition in a fair and orderly manner, and inspire market vitality.</td>
<td>To ensure fair market competition. The Guidelines consistently treat market players equally, aim to prevent and prohibit monopolistic behaviors, improve the laws and regulations on the identification of monopolistic behaviors of platform enterprises, ensure fair competition in the platform economy, prevent disordered capital expansion, support the innovative development of platform enterprises, and enhance international competitiveness.</td>
</tr>
</tbody>
</table>

To safeguard the legitimate rights and interests of all concerned parties. Many parties are involved in the development of platform economy. The aim of anti-monopoly regulation is not only to protect fair market competition and safeguard and promote the development of the platform, but also to safeguard the legitimate rights and interests of all parties concerned including business undertakings and consumers within the platform, so as to enable the whole society to share the achievements of technological progress and economic development of the platform economy and realize the harmonious coexistence and healthy development of the platform economy. | To safeguard the legitimate rights and interests of all parties. Many parties are involved in the development of the platform economy. The aim of anti-monopoly regulation is not only to protect the fair competition in the field of the platform economy and give full play to the function of platform economy to promote the optimization of resource allocation, technological progress and efficiency improvements, but also to safeguard the legitimate rights and interests of all parties concerned including business undertakings, consumers and employees on the platform, as well as to strengthen the overall coordination between anti-monopoly law enforcement and industrial |

<tr>
<td>regulation, so as to enable the whole society to share the achievements of technological progress and economic development of the platform economy and achieve the harmonious coexistence and healthy development of the platform economy.</td>
<td></td>
</tr>
</tbody>
</table>

First, the Guidelines add “preventing disordered capital expansion” into its fundamental principle. The principle of “preventing disordered capital expansion” has been referred in the conference of the CPC Central Committee Politburo and the Central Economic Work Conference successively held in December 2020, and “strengthening anti-monopoly and preventing disordered capital expansion” has also been stated as one of eight key tasks by the Central Economic Work Conference, demonstrating the determination of the State to strengthen anti-monopoly regulation, enhance anti-monopoly law enforcement, and promote capital to play the role of facilitating innovation and enhancing consumer welfare and public interests. In this respect, measures taken by the State include encouraging platform enterprises to pursue original and basic scientific and technological innovation by utilizing the advantages of data and algorithms. Correspondingly, the Guidelines delete the expression of “maintain a fair, open and inclusive development environment.” We predict that anti-monopoly law enforcement work will trend toward strengthening in the future, supported by detailed measures such as those provided for under the Interim Measures for Administration of Subsidies for Anti-monopoly Work.

Second, added to the Guidelines as their fundamental principles are “support the innovative development of platform enterprises” and “enhance international competitiveness”, indicating the intent of regulators to maintain a balance between strengthening domestic anti-monopoly law enforcement and enhancing enterprises’ global competitiveness. It should be noted that anti-monopoly law targets monopolistic practices rather than large-scale platform enterprises. Only if we properly control monopolistic practices can we ensure platform enterprises develop on the right track and gain innovative capacity and competitive strength. On the contrary, over-regulation may occur if anti-monopoly enforcement is isolated from specific monopolistic practices, which ultimately will hurt the innovation and competitiveness of platform enterprises.

Third, the Guidelines stipulate a strengthening of the overall planning and coordination between anti-monopoly law enforcement and industry supervision, indicating China’s emphasis on exercising coordinated supervision of monopolistic practices. Previously, the People’s Bank of China (PBOC) called for “overall coordinated supervision” in Article 64 of Regulations on Non-bank Payment Institutions (Draft for Comment), proposing that non-bank payment institutions engaging in monopolistic behaviors be jointly punished in accordance with relevant laws and regulations by the anti-monopoly enforcement authorities under the State Council and the PBOC. However, detailed rules for implementing this “joint-punishment” mechanism in practice still need to be explored by anti-monopoly and industry supervisory authorities. OECD pointed out in a publication entitled Relationship between Regulators and Competition Authorities that competition authorities generally take a firmer stance on protecting competition in various industries, have more knowledge of market competition, are more experienced in dealing with restrictive competitive practices, and are less likely to be deterred by the regulation of industry regulators. Therefore, anti-
monopoly law enforcement authorities may need to properly integrate their own competition concerns with the concerns of industry regulators to avoid what OECD suggests could otherwise lead to the resource duplication or inconsistent, investment-discouraging application of two sets of policies.\(^2\)

**Key adjustments to the definition of relevant markets**

The Guidelines substantially revise content concerning the definition of relevant market. Below, we analyze two major adjustments in this aspect:

<table>
<thead>
<tr>
<th>Exposure Draft</th>
<th>Guidelines</th>
</tr>
</thead>
</table>
| **Article 4 Definition of Relevant Markets**  
... ...
Substitution analysis will be used to define relevant product markets in the platform economy. For defining the relevant product market, demand substitution analysis may be conducted based on such factors as platform functions, business models, user groups, multi-sided markets, and offline transactions; if supply substitution competition exerts similar constraints on undertakings’ behaviors as demand substitution, supply substitution analysis shall be conducted based upon factors such as market entry, technical barriers, network effects and cross-border competition. In the platform economy, competition between undertakings is usually centered around their core business, and lies in how they obtain extensive and lasting user attention. Therefore, relevant product market should not be defined merely based upon basic services of the platform, possible cross-platform network effects should also be considered to determine whether an independent market or multiple relevant markets will be defined with respect to the platform. | **Article 4 Definition of Relevant Markets**  
... ...
Relevant product market  
Substitution analysis will be used to define relevant product markets in the platform economy. In defining the relevant product market, demand substitution analysis may be conducted based on such factors as platform functions, business models, application scenarios, user groups, multi-sided markets and offline transactions; if supply substitution competition exerts similar constraints on undertakings’ behaviors as demand substitution, supply substitution analysis shall be conducted based upon such factors as market entry, technical barriers, network effects, lock-in effect, transfer cost and cross-border competition. Specifically, we may either define one relevant market based upon product on the platform side or define multiple relevant product markets according to the multilateral commodities involved on the platform, by taking into account the mutual relationship and interactions between the different relevant product markets. A relevant product market can also be defined based on the platform as a whole when the cross-platform network effect of the platform can impose sufficient competition constraints on the platform undertakings. |

Necessity of relevant market definition in various anti-monopoly cases
Adhere to the principle of case analysis, different types of monopoly cases have different actual

2 Ibid. at pgs. 9-10.
There is no need to clearly define a relevant market in order to identify whether undertakings have reached the following monopolistic agreements: horizontal monopoly agreements such as agreements on price fixing and market segmenting reached among undertakings in the platform economy, vertical monopoly agreements such as agreements on fixing resale prices and limiting minimum resale prices.

Identifying the relevant market is generally the first step to identify whether undertakings have engaged in abuse of dominant market position in the platform economy.

In carrying out an anti-monopoly review of a concentration of undertakings in the platform economy, it is generally necessary to define the relevant market.

In the following exceptional circumstances, the authority may directly determine that undertakings in the platform economy have implemented monopolistic conduct without defining the relevant market: the monopolistic conduct is proved by sufficient and direct evidence; conduct that is possible only if the market dominance exists has lasted for a long time and have produced obviously harmful effects; and defining the relevant market proves very difficult or impossible for lack of sufficient market conditions.

First, the Guidelines further specify methods for defining relevant markets in the platform economy. The Exposure Draft proposed that the cross-platform network effect could define either an independent market or multiple relevant markets without further analyzing what methods would be used to define such markets. The Guidelines provide specific methods to be used to define relevant markets. Specifically:

1. Relevant market is defined based upon the products on the platform. For example, in reviewing behaviors of an online car-hailing platform that imposes transaction conditions on drivers, the relevant market may be defined merely based upon drivers by examining whether the platform has a market dominant position in the recruitment of drivers.

2. Where a platform involves multiple products, multiple relevant markets may be defined based on the relationships among the products or multiple relevant markets may be combined into one market where there is a strong cross-platform network effect. We discussed in our November 12 article that the U.S. Supreme Court decided a credit card antitrust case in 2018 that ruled on whether a “two-
sided platform” should be defined as one or two relevant markets with respect to cardholders and merchants\(^3\). In that case, whether monopolistic behavior could be substantiated, exempted, or justified rested upon how the relevant market was defined. Similarly, this conclusion will vary substantially if we use different methods of defining the relevant market when we examine whether monopolistic behavior has an effect on consumers.

3. As mentioned above, the Commission raises the restrictiveness of “cross-platform network effects” as determinative of whether there is one or multiple relevant markets. This idea echoes a proposition the U.S. Supreme Court put forth in its 2018 decision, in which the court ruled that “indirect network effects” determine whether or not a platform is considered a “two-sided transaction market.” “Indirect network effects” is similar in meaning to “cross-platform network effects,” with both providing that the value of a platform to customers on one side depends on the number of customers on the other. Judging from the practices of other jurisdictions, credit card organizations would generally be held as platforms subject to significant cross-platform network effect. In contrast, the “newspaper-advertising” two-sided market would generally be considered subject to less cross-platform network effect, because the readers of newspapers do not care about the quantity of advertising on the other side of the platform, so the cross-platform network effect can only affect the one side of the platform.

In addition, the Exposure Draft mentioned the concept of “attention competition,” proposing a possibility of incorporating platforms with different principal businesses into one same relevant market (for example, that social networking platforms and video platforms be incorporated into one relevant market due to the existence of attention competition). However, the concept was struck from the Guidelines, indicating that attention competition will not be considered a factor in defining relevant markets, but may merely be used to analyze market power once the relevant market has been defined.

Second, the Guidelines do not contain a provision found in the Exposure Draft that would have allowed regulators to directly identify abuse of dominance practices without defining the relevant market, provided certain conditions were met. As we mentioned in our November 12 article, this provision would have helped to reduce law enforcement difficulties in certain cases, but its application would have needed to satisfy a series of conditions, such as proving “the monopolistic behavior is proven by the sufficient and direct evidence; conduct that is possible only if market dominance has lasted for a long time and has produced obviously harmful effects,” and the relevant conditions would have required further refinement. In fact, the Federal Trade Commission and Department of Justice explicitly puts forth in its Horizontal Merger Guidelines that “[law enforcement] analysis need not start with market definition\(^4\)” and many scholars have also proposed more straightforward approaches to competition analysis — the problem is that we still lack a universally applicable, reliable, and widely accepted economic tool in practice. We believe the Guidelines have fully considered the feasibility of this issue in practice.

Nevertheless, as we have pointed out in our November 12 article, the Supreme People’s Court indicated in a 2013 judgment that “the relevant market need not be explicitly and clearly defined in certain abuse of market dominance cases … Even if the relevant market is not clearly defined, the regulator may still

assess the market position of the undertaking and the possible market impact of the alleged monopolistic behaviors by examining direct evidence of exclusion or restriction of competition.” Therefore, while the relevant provisions were struck from the Guidelines, there still remains the possibility that regulators may still not clearly define the relevant market in some abuse of dominance cases in practice.

**Key adjustments for monopolistic agreements**

We understand that adjustments in monopoly agreements are akin to technical adjustments compared with adjustments in fundamental principles and in the definition of relevant markets. We believe the following adjustments warrant special attention:

<table>
<thead>
<tr>
<th>Exposure Draft</th>
<th>Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Article 5 Form of monopolistic agreements</strong> Monopoly agreements in the platform economy mainly refer to agreements, decisions, or other concerted actions reached among platform undertakings and undertakings within platforms to eliminate or restrict competition. Such agreements and decisions may be made in writing, oral, or otherwise. Other concerted actions refer to undertakings who in fact engage in concerted acts, but no substantive agreement exists.</td>
<td><strong>Article 5 Form of monopolistic agreements</strong> Monopoly agreements in the platform economy mainly refer to agreements, decisions, or other concerted actions reached among platform undertakings and undertakings within platforms to eliminate or restrict competition. Such agreements and decisions may be made in writing, oral, or otherwise. Other concerted actions refer to undertakings who engage in concerted actions through data, algorithms, platform rules, or other means but there exists no substantive agreement or decision, excluding parallel behavior conducted by undertakings out of independent declarations of will such as price leadership.</td>
</tr>
<tr>
<td><strong>Article 7 Vertical monopoly agreements</strong> ... ... Analyze whether the most-favored-nation treatment clause constitutes a vertical monopoly agreement, and comprehensively consider the business motives of the undertaking to sign the clause, the undertaking's ability to control the market, and the impact of the implementation of the clause on market competition, consumer interests and innovation, etc. Exclusivity agreements reached between platform undertakings and transaction counterparties may constitute other monopoly agreements as prescribed in Article 14 of the Anti-monopoly Law. When examining whether an exclusivity agreement would exclude or restrict competition, factors considered by anti-monopoly law enforcement agencies generally include the market power of the platform undertaking,</td>
<td><strong>Article 7 Vertical monopoly agreements</strong> ... ... A monopoly agreement or abuse of dominant market position may be constituted where a platform undertaking requires undertakings within the platform to offer it transaction conditions that are equal to or superior to those offered to other competitive platforms in terms of price, supply quantity, etc. In order to analyze whether the above conduct constitutes a vertical monopoly agreement as provided in paragraph 3 of Article 14 of the Anti-monopoly Law, factors to be considered may include the market power of the platform undertaking, the status of competition in the relevant market, to what extent market entry will be restricted for other undertakings, the impact of such conduct on consumer interests and innovation, etc.</td>
</tr>
<tr>
<td>Article 8 Hub-and-spoke agreements</td>
<td>Article 8 Hub-and-spoke agreements</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-----------------------------------</td>
</tr>
<tr>
<td>Competitive undertakings may reach hub-and-spoke agreements with the same effect as horizontal monopoly agreements by virtue of the vertical relationship with the undertakings or platform undertakings may organize and coordinate the competitive undertakings to reach such agreements. The following factors need to be considered in order to analyze whether an agreement constitutes a monopoly agreement regulated by the Anti-monopoly Law: whether a monopoly agreement has been reached and implemented between competitive undertakings with effects to exclude or restrict competition in the relevant market by using means including technical means, platform rules, data and algorithms, etc.</td>
<td>Competitive undertakings within the platform may reach hub-and-spoke agreements with the same effect as horizontal monopoly agreements by virtue of the vertical relationship with the undertakings or platform undertakings may organize and coordinate competitive undertakings to reach such agreements. The following factors need to be considered when analyzing whether the agreement constitutes a monopoly agreement described under Article 13 and 14 of the Anti-monopoly Law: whether a monopoly agreement has been reached and implemented between competitive undertakings within the platform with the effects to exclude or restrict competition in the relevant market by using means including technical means, platform rules, data and algorithms, etc.</td>
</tr>
</tbody>
</table>

First, in terms of horizontal monopoly agreements, the Guidelines specify that independent price following does not constitute a price cartel. This provision clarifies the status of price following as a normal competitive behavior in the market economy, so as to avoid over-interpreting the scope of concerted actions that would affect ordinary commercial decisions. It is important to note that “data” is also specified as a means by which to engage in concerted actions. We understand “data” here to refer to the exchange of data. However, it would be difficult to prove that there exists price following conducted out of independent expressions of will when sensitive information is exchanged between competitors and those competitors engage in this practice in concert, even if they have not directly communicated their intent to take concerted action.

Second, the Guidelines clarify the meaning of the most-favored-nation treatment clause when it is used in the platform economy, pointing out that the clause cuts across both vertical monopoly agreements and abuse of market dominant position. Meanwhile, the Guidelines strike the term “most-favored-nation treatment clause” and emphasize review of form of acts of the business undertakings. Indeed, in addition to the most-favored-nation treatment clause, other clauses in vertical monopoly agreements may also involve vertical monopoly agreements and abuse of dominance, because most abuse dominance behaviors involve the conclusion of relevant agreements. In other words, if platforms engage in acts that involve both vertical monopoly agreements and abuse of dominance, they may still be held to violate relevant vertical monopoly agreement provisions even if they are found not to have engaged in abuse of dominance for lack of dominant market position. Possible scenarios include:

1. The first scenario is the enterprise occupies a market share that is greater than the market power
standard but is lower than the market dominance standard. For example, the European Commission, in paragraph 26 of the Guidelines on the Application of Article 81 (3) [101 (3)] of the Treaty [Establishing the European Community]\(^5\), notes that enterprises may occupy less market share to reach an illegal vertical agreement than to engage in abuse of dominance as stipulated in Article 102 of the TFEU. We believe that competition authorities in the European Union would hold that an undertaking that has 30% or more market share could still be deemed to have illegally concluded a vertical agreement even if it does not have a dominant market position, based on provisions of the Vertical Block Exemption Regulation that stipulate only a 30% market share exemption standard for vertical agreements. Similarly, in China, the Anti-monopoly Guidelines on the Automobile Industry also provide a 30% market share standard for vertical, geographic, and customer restrictions, which may be of great reference value for undertakings in other industries when they design most-favored-nation treatment clauses or other vertical agreement clauses.

2. The second scenario involves cumulative monopolistic effects. The Anti-monopoly Guidelines on the Automobile Industry describe “cumulative monopolistic effects” as “most or even all undertakings in the relevant market have all adopted similar vertical monopoly agreements, and a vertical restrictions network which fully covers the entire relevant market has been formed thereupon.” Where there exist cumulative monopolistic effects, undertakings may still be identified as being in violation even if their market share is relatively low (even lower than the 30% market share standard as mentioned above).

Third, in the provisions applicable to hub-and-spoke agreements, the Commission retained for regulators the flexibility to potentially apply either Article 13 or 14 to platform undertakings. In the future, we need to observe how relevant provisions of the Guidelines will be adjusted if Article 17 is retained in the current revision draft of the Anti-monopoly Law of the People’s Republic of China, which would prohibit business undertakings from organizing and facilitating the conclusion of monopoly agreements.

**Key adjustments in abuse of dominant market position**

With respect to the abuse of market dominant position, the Guidelines retain core content such as the analysis framework for predatory pricing (below-cost sales), “choosing-one-from-two” analysis frameworks, factors to consider when determining whether the platform constitutes necessary facilities, and prohibiting the implementation of different transaction terms based on big data and algorithms. Many adjustments in this area involve technical adjustments, including supplementing factors to consider when determining existence of market dominant position, adjusting circumstances that constitute abuse of the market dominant position, and providing more justifications for below-cost sales. Of these adjustments, we believe the following warrant particular attention:

---

5 26. The creation, maintenance or strengthening of market power can result from a restriction of competition between the parties to the agreement. It can also result from a restriction of competition between any one of the parties and third parties, e.g. because the agreement leads to foreclosure of competitors or because it raises competitors’ costs, limiting their capacity to compete effectively with the contracting parties. Market power is a question of degree. The degree of market power normally required for the finding of an infringement under Article 81(1) in the case of agreements that are restrictive of competition by effect is less than the degree of market power required for a finding of dominance under Article 82.

### Article 17 Differential treatment

The following factors may be considered when analyzing whether differential treatment is constituted:

- Implementing differentiated transaction prices or other transaction terms based on big data and algorithms and according to the financial strength, consumption preferences, user habits, etc. of the transaction counterparties;
- Implementing transaction prices or other transaction terms differentiated for old and new transaction counterparties based on big data and algorithms;
- Implementing differentiated standards, rules, and algorithms;
- Implementing differentiated payment terms and transaction methods.

Undertakings in the platform economy may implement differentiated transaction terms for the following justifiable reasons:

- **First order** preferential treatment offered to new users within reasonable period of time;
- … …

### Article 17 Differential treatment

The following factors may be considered when analyzing whether differential treatment is constituted:

- Implementing differentiated transaction prices or other transaction terms based on big data and algorithms and according to the financial strength, consumption preferences, user habits, etc. of the transaction counterparties;
- Implementing differentiated standards, rules, and algorithms;
- Implementing differentiated payment terms and transaction methods.

Undertakings in the platform economy may implement differentiated transaction terms for the following justifiable reasons:

- Preferential treatment offered to new users within reasonable period of time;
- … …

First, the Guidelines add two justifiable reasons for predatory pricing, namely, “attraction of new customers within a reasonable period of time” and “carrying out promotion activities within a reasonable period” - both are common business practices taken by platform companies in market competition, indicating the Commission has considered relevant business practices.

Second, it is controversial in business circles as to whether data can constitute essential facilities, as studies of data are still in their initial stages. The Exposure Draft failed to resolve this controversy, although it stipulated general rules for identifying essential facilities to be used when examining whether data constitutes essential facilities. In this area, the Guidelines adopt a flexible approach by taking data as one of the considerations for determining whether a platform constitutes an essential facility, while striking provisions on identifying data to constitute an essential facility. Similarly, the *Anti-monopoly Guidelines on Intellectual Property Rights* in Article 16 struck references to “essential facilities” that were mentioned in its exposure draft, so as to avoid disputes over this issue by avoiding defining whether intellectual property rights can constitute essential facilities.
Third, with respect to attaching unreasonable transactions terms, the Guidelines impose limitations on the scope of “compulsory user information collection” as referenced in the Exposure Draft, by making it clear that information prohibited from collection refers to “unnecessary” user information, thus avoiding excessive regulation by regulators. Meanwhile, the Guidelines clearly prohibit platforms from attaching unrelated transaction procedures and service items in dealing with users, which are common unreasonable terms that many platforms implement in practice.

Fourth, with respect to differential treatment, the Guidelines strike the provision in the Exposure Draft that would have prohibited platforms from “implementing transaction prices or other transaction terms differentiated for old and new transaction counterparties based on big data and algorithms.” In our opinion, this adjustment is reasonable because: (1) it is a common practice for platform enterprises to provide preferential treatment to new customers within a reasonable period of time (not limited to the first transaction the new customer concludes). Therefore, the Exposure Draft faced criticism for being too harsh for defining this practice as illegal, although violations could have been exempted if the platform could prove such practices were implemented for justifiable reasons; and (2) the practice “implementing transaction prices or other transaction terms differentiated for old and new transaction counterparties based on big data and algorithms” is covered by situations of differential treatment as listed in the first paragraph, “[i]mplementing differentiated transaction prices or other transaction terms based on big data and algorithms and according to the financial strength, consumption preferences, user habits, etc. of the transaction counterparties.” Nevertheless, platform enterprises still need to note the “reasonable period of time” criterion so as to avoid being deemed to implement differential treatment based upon big data or algorithms.

Key adjustments to concentrations of undertakings

In terms of concentrations of undertakings, the Guidelines retain the core content of the Exposure Draft, such as mandatory declaration of control structure agreements, and stressing that regulators shall pay close attention to acquisitions of start-ups and emerging platforms, acquisitions that are not notifiable due to free or low-price policies adopted by undertakings and acquisitions that result in a high market concentration but a small market size. Adjustments in this area are basically technical improvements in terms of consistency, completeness and accuracy, and wording. Of those adjustments, the following warrant special attention:

<table>

</table>

First, regarding the platform turnover calculation, the Guidelines further specify that the turnover of platform enterprises includes sales income and service fee. With respect to the calculation of sales income, the Guidelines divide platforms into two circumstances, i.e., the platforms participating in the market competition on one side of the platform (e.g., self-operated stores) and platforms playing a leading role in the transaction. Although the Guidelines do not specify what circumstances constitute “play a leading role in the transaction,” we understand leadership forms when platform enterprises can decide the transaction terms for the platform side, such as online car-hailing platform.

Second, the Guidelines categorize data as facilities and stipulates that regulators may conditionally approve concentrations of undertakings by ordering open data access. In addition, the Guidelines add “undertaking of compatibility or not reducing the level of interoperability” as a behavioral condition upon which concentrations of undertakings may be conditionally approved, whose main purpose is to prevent owners of facilities from excluding third parties by technical means.

**Conclusion**

Compared with the Exposure Draft, the Guidelines present substantial technical adjustments and improvements. In addition, the Guidelines also strike certain substantive content that is subject to debate and improve relevant provisions according to commercial practices so as to further reduce legal uncertainty and promote the understanding of platform enterprise regulatory policies. Despite this, there remain many issues for regulators to further clarify and we expect detailed measures to be promulgated in relevant competition policies and in enforcement practice. We believe that the implementation of the Guidelines will promote the healthy development of the platform economy in China.
